INTRODUCTION
PART TWO

The part one of this course has shown like identifying the geometric structures in the financial markets. Also it was shown that with the geometric application of the PTV, relationships, and the acquaintance of the cubical structure, the borders of the square can be determine to you in advance payment of years.

It is WITHIN the BORDERS Of the SQUARE THAT the CYCLES ARE REPEATED WITH EXPECTABLE PERIODICITA'.

When it begins a new square, the cycles within that square are repeated with a regularity that of usual differs from those in the previous one squared. Therefore, the acquaintance of the Part of this course is critical if she is from being completed an taken care of analysis of the cycle over every extended period of time.

The traditional analysts of the cycle mistake in their approach trying to project the cycles beyond the limits of the square in which they are defined. Like demonstrated in Part I, when a square ends wheel outside from the vision.

Part II will show as the scientific phenomenon of the "simpatetica resonance" sincronizza the cycles finds in the securities market with the expectable periods of planets and their harmonicas to you.

The tables will be used wide in Part II, like it were in Part I, in order to supply the data of support to all postulate to you introduce to you. These data supply the unquestionable test of the correlation between the planetary cycles of the securities market and cycles. The numbers not mentono.

Not to be intimidated from the full tables of numbers. Simply moments in the history record the positions of planets to the different. It is important that the reader takes the time for ripassare these data, since is here and in the diagrams that the last test resides.

This course makes no affirmation that cause relation exists one - effect between the planetary movement and the cycles of the securities market. The data simply are collected and exposed, showing the correlation.

The details of these cycles can be written material volumes describing, especially in the areas where they succeed doubles quantity or triple maximums or minimums. These types of formations happen not exactly when different cycles close catch up their maximums or minimums to every other, but at the same moment. When it is employed more time having studied these multiple maximums and minimums, a greater knowledge of the truth of the theories introduced in this course will be conquered.

If the reader has difficulty with the concept that connects the cycles of the securities market with the planetary cycles, the same ones turn out to you can be caught up watching to the aces of fifteen degrees of the elliptic cycles, that they have the same regularity of planets. It is simply easier to use planets because of the availability of data.
